This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS. Oracle programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, delivered to U.S. Government end users are "commercial computer software" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, shall be subject to license terms and license restrictions applicable to the programs. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle and Java are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Xeon are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Opteron, the AMD logo, and the AMD Opteron logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Using This Documentation

- **Overview** The *Oracle Solaris x86 Assembly Language Reference Manual* documents the syntax of the Oracle Solaris x86 assembly language. This manual is provided to help experienced programmers understand the assembly language output of Oracle Solaris compilers. This manual is neither an introductory book about assembly language programming nor a reference manual for the x86 architecture.
- **Audience** This manual is intended for experienced x86 assembly language programmers who are familiar with the x86 architecture.
- **Required knowledge** You should have a thorough knowledge of assembly language programming in general and be familiar with the x86 architecture in specific. You should be familiar with the ELF object file format.

Product Documentation Library

Documentation and resources for this product and related products are available at http://www.oracle.com/pls/topic/lookup?ctx=E53394.

Feedback

Provide feedback about this documentation at http://www.oracle.com/goto/docfeedback.

· · · CHAPTER 1

Overview of the Oracle Solaris x86 Assembler

This chapter provides a brief overview of the Oracle Solaris x86 assembler as. This chapter discusses the following topics:

- "1.1 Assembler Overview" on page 15
- "1.2 Syntax Differences Between x86 Assemblers" on page 15

1.1 Assembler Overview

The Oracle Solaris x86 assembler as translates Oracle Solaris x86 assembly language into Executable and Linking Format (ELF) relocatable object files that can be linked with other object files to create an executable file or a shared object file. (See Chapter 13, "Object File Format" in *Oracle Solaris 11.3 Linkers and Libraries Guide* for a complete discussion of ELF object file format.) The assembler supports macro processing by the C preprocessor (cpp) or the m4 macro processor.

1.2 Syntax Differences Between x86 Assemblers

There is no standard assembly language for the x86 architecture. Vendor implementations of assemblers for the x86 architecture instruction sets differ in syntax and functionality. The syntax of the Oracle Solaris x86 assembler is compatible with the syntax of the assembler distributed with earlier releases of the UNIX operating system (this syntax is sometimes termed "AT&T syntax"). Developers familiar with other assemblers derived from the original UNIX assemblers, such as the Free Software Foundation's gas, will find the syntax of the Oracle Solaris x86 assembler very straightforward.

However, the syntax of x86 assemblers distributed by Intel and Microsoft (sometimes termed "Intel syntax") differs significantly from the syntax of the Oracle Solaris x86 assembler. These differences are most pronounced in the handling of instruction operands:

 The Oracle Solaris and Intel assemblers use the opposite order for source and destination operands.

- The Oracle Solaris assembler specifies the size of memory operands by adding a suffix to the instruction mnemonic, while the Intel assembler prefixes the memory operands.
- The Oracle Solaris assembler prefixes immediate operands with a dollar sign (\$) (ASCII 0x24), while the Intel assembler does not delimit immediate operands.

See Chapter 2, "Oracle Solaris x86 Assembly Language Syntax" for additional differences between x86 assemblers.

Oracle Solaris x86 Assembly Language Syntax

This chapter documents the syntax of the Oracle Solaris x86 assembly language.

- "2.1 Lexical Conventions" on page 17
- "2.2 Instructions, Operands, and Addressing" on page 21
- "2.3 Assembler Directives" on page 23

2.1 Lexical Conventions

This section discusses the lexical conventions of the Oracle Solaris x86 assembly language.

2.1.1 Statements

An x86 assembly language program consists of one or more files containing *statements*. A *statement* consists of *tokens* separated by *whitespace* and terminated by either a newline character (ASCII 0x0A) or a semicolon (;) (ASCII 0x3B). *Whitespace* consists of spaces (ASCII 0x20), tabs (ASCII 0x09), and form feeds (ASCII 0x0B) that are not contained in a string or comment. More than one statement can be placed on a single input line provided that each statement is terminated by a semicolon. A statement can consist of a *comment*. *Empty statements*, consisting only of whitespace, are allowed.

2.1.1.1 Comments

A *comment* can be appended to a statement. The comment consists of the slash character (/) (ASCII 0x2F) followed by the text of the comment. The comment is terminated by the newline that terminates the statement.

2.1.1.2 Labels

A *label* can be placed at the beginning of a statement. During assembly, the label is assigned the current value of the active location counter and serves as an instruction operand. There are two types of labels: *symbolic* and *numeric*.

Symbolic Labels

A *symbolic* label consists of an *identifier* (or *symbol*) followed by a colon (:) (ASCII 0x3A). Symbolic labels must be defined only once. Symbolic labels have *global* scope and appear in the object file's symbol table.

Symbolic labels with identifiers beginning with a period (.) (ASCII 0x2E) are considered to have *local* scope and are not included in the object file's symbol table.

Numeric Labels

A *numeric* label consists of a unsigned decimal *int32* value followed by a colon (:). Numeric labels are used only for local reference and are not included in the object file's symbol table. Numeric labels have limited scope and can be redefined repeatedly.

When a numeric label is used as a reference (as an instruction operand, for example), the suffixes b ("backward") or f ("forward") should be added to the numeric label. For numeric label N, the reference Nb refers to the nearest label N defined *before* the reference, and the reference Nf refers to the nearest label N defined *after* the reference. The following example illustrates the use of numeric labels:

```
1:
            / define numeric label "1"
            / define symbolic label "one"
one:
/ ... assembler code ...
      1f
            / jump to first numeric label "1" defined
            / after this instruction
            / (this reference is equivalent to label "two")
ami
            / jump to last numeric label "1" defined
            / before this instruction
            / (this reference is equivalent to label "one")
1:
            / redefine label "1"
two:
            / define symbolic label "two"
     1b
            / jump to last numeric label "1" defined
jmp
            / before this instruction
            / (this reference is equivalent to label "two")
```

2.1.2 Tokens

There are five classes of tokens:

- Identifiers (symbols)
- Keywords
- Numerical constants
- String Constants
- Operators

2.1.2.1 Identifiers

An *identifier* is an arbitrarily-long sequence of letters and digits. The first character must be a letter; the underscore (_) (ASCII 0x5F) and the period (.) (ASCII 0x2E) are considered to be letters. Case is significant: uppercase and lowercase letters are different.

2.1.2.2 Keywords

Keywords such as x86 instruction mnemonics ("opcodes") and assembler directives are reserved for the assembler and should not be used as identifiers. See Chapter 3, "Instruction Set Mapping" for a list of the Oracle Solaris x86 mnemonics. See "2.3 Assembler Directives" on page 23 for the list of as assembler directives.

2.1.2.3 Numerical Constants

Numbers in the x86 architecture can be *integers* or *floating point*. Integers can be *signed* or *unsigned*, with signed integers represented in two's complement representation. Floating-point numbers can be: single-precision floating-point; double-precision floating-point; and double-extended precision floating-point.

Integer Constants

Integers can be expressed in several bases:

- **Decimal.** Decimal integers begin with a non-zero digit followed by zero or more decimal digits (0–9).
- **Binary.** Binary integers begin with "0b" or "0B" followed by zero or more binary digits (0, 1).
- **Octal.** Octal integers begin with zero (0) followed by zero or more octal digits (0–7).

■ **Hexadecimal.** Hexadecimal integers begin with "0x" or "0X" followed by one or more hexadecimal digits (0–9, A–F). Hexadecimal digits can be either uppercase or lowercase.

Floating Point Constants

Floating point constants have the following format:

- **Sign** (optional) either plus (+) or minus (–)
- **Integer** (optional) zero or more decimal digits (0–9)
- **Fraction** (optional) decimal point (.) followed by zero or more decimal digits
- **Exponent** (optional) the letter "e" or "E", followed by an optional sign (plus or minus), followed by one or more decimal digits (0–9)

A valid floating point constant must have either an integer part or a fractional part.

2.1.2.4 String Constants

A *string* constant consists of a sequence of characters enclosed in double quotes (") (ASCII 0x22). To include a double-quote character ("), single-quote character ('), or backslash character (\) within a string, precede the character with a backslash (\) (ASCII 0x5C). A character can be expressed in a string as its ASCII value in octal preceded by a backslash (for example, the letter "J" could be expressed as "\112"). The assembler accepts the following escape sequences in strings:

Escape Sequence	Character Name	ASCII Value (hex)	
\n	newline	0A	
\r	carriage return	0D	
\ b	backspace	08	
\t	horizontal tab	09	
\f	form feed	0C	
\v	vertical tab	0B	

2.1.2.5 Operators

The assembler supports the following operators for use in expressions. Operators have no assigned precedence. Expressions can be grouped in square brackets ([]) to establish precedence.

- + Addition
- Subtraction

\ *	Multiplication
V	Division
&	Bitwise logical AND
I	Bitwise logical OR
>>	Shift right
<<	Shift left
\%	Remainder
!	Bitwise logical AND NOT
^	Bitwise logical XOR

Note - The asterisk (*), slash (/), and percent sign (%) characters are overloaded. When used as operators in an expression, these characters must be preceded by the backslash character (\).

2.2 Instructions, Operands, and Addressing

Instructions are operations performed by the CPU. *Operands* are entities operated upon by the instruction. *Addresses* are the locations in memory of specified data.

2.2.1 Instructions

An *instruction* is a statement that is executed at runtime. An x86 instruction statement can consist of four parts:

- Label (optional)
- Instruction (required)
- Operands (instruction specific)
- Comment (optional)

See "2.1.1 Statements" on page 17 for the description of labels and comments.

The terms *instruction* and *mnemonic* are used interchangeably in this document to refer to the names of x86 instructions. Although the term *opcode* is sometimes used as a synonym for

instruction, this document reserves the term *opcode* for the hexadecimal representation of the instruction value.

For most instructions, the Oracle Solaris x86 assembler mnemonics are the same as the Intel or AMD mnemonics. However, the Oracle Solaris x86 mnemonics might appear to be different because the Oracle Solaris mnemonics are suffixed with a one-character modifier that specifies the size of the instruction operands. That is, the Oracle Solaris assembler derives its operand type information from the instruction name and the suffix. If a mnemonic is specified with no type suffix, the operand type defaults to long. Possible operand types and their instruction suffixes are:

b Byte (8–bit)
w Word (16–bit)
Long (32–bit) (default)

The assembler recognizes the following suffixes for x87 floating-point instructions:

[no suffix] Instruction operands are registers only

Quadword (64-bit)

l ("long") Instruction operands are 64-bit

s ("short") Instruction operands are 32–bit

See Chapter 3, "Instruction Set Mapping" for a mapping between Oracle Solaris x86 assembly language mnemonics and the equivalent Intel or AMD mnemonics.

2.2.2 Operands

An x86 instruction can have zero to three operands. Operands are separated by commas (,) (ASCII 0x2C). For instructions with two operands, the first (lefthand) operand is the *source* operand, and the second (righthand) operand is the *destination* operand (that is, $source \rightarrow destination$).

Note - The Intel assembler uses the opposite order (*destination* ← *source*) for operands.

Operands can be *immediate* (that is, constant expressions that evaluate to an inline value), *register* (a value in the processor number registers), or *memory* (a value stored in memory). An *indirect* operand contains the address of the actual operand value. Indirect operands are specified by prefixing the operand with an asterisk (*) (ASCII 0x2A). Only jump and call instructions can use indirect operands.

■ *Immediate* operands are prefixed with a dollar sign (\$) (ASCII 0x24)

- *Register* names are prefixed with a percent sign (%) (ASCII 0x25)
- Memory operands are specified either by the name of a variable or by a register that contains the address of a variable. A variable name implies the address of a variable and instructs the computer to reference the contents of memory at that address. Memory references have the following syntax:

segment:offset(base, index, scale).

- *Segment* is any of the x86 architecture segment registers. *Segment* is optional: if specified, it must be separated from *offset* by a colon (:). If *segment* is omitted, the value of %ds (the default segment register) is assumed.
- Offset is the displacement from segment of the desired memory value. Offset is optional.
- *Base* and *index* can be any of the general 32—bit number registers.
- *Scale* is a factor by which *index* is to be multipled before being added to *base* to specify the address of the operand. *Scale* can have the value of 1, 2, 4, or 8. If *scale* is not specified, the default value is 1.

Some examples of memory addresses are:

movl var, %eax	Move the contents of memory location var into number register eax .
movl %cs:var, %eax	Move the contents of memory location var in the code segment (register %cs) into number register %eax.
movl \$var, %eax	Move the address of var into number register %eax.
<pre>movl array_base(% esi), %eax</pre>	Add the address of memory location array_base to the contents of number register %esi to determine an address in memory. Move the contents of this address into number register %eax.
movl (%ebx, %esi, 4), %eax	Multiply the contents of number register %esi by 4 and add the result to the contents of number register %ebx to produce a memory reference. Move the contents of this memory location into number register %eax.
<pre>movl struct_base(% ebx, %esi, 4), %eax</pre>	Multiply the contents of number register %esi by 4, add the result to the contents of number register %ebx, and add the result to the address of struct_base to produce an address. Move the contents of this address into number register %eax.

2.3 Assembler Directives

Directives are commands that are part of the assembler syntax but are not related to the x86 processor instruction set. All assembler directives begin with a period (.) (ASCII 0x2E).

.align integer, The .align directive causes the next data generated to be aligned modulo pad integer bytes. Integer must be a positive integer expression and must be a power of 2. If specified, pad is an integer byte value used for padding. The default value of pad for the text section is 0x90 (nop); for other sections, the default value of *pad* is zero (0). .ascii "string" The .ascii directive places the characters in *string* into the object module at the current location but does *not* terminate the string with a null byte (\0). String must be enclosed in double quotes (") (ASCII 0x22). The .ascii directive is not valid for the .bss section. .bcd integer The .bcd directive generates a packed decimal (80-bit) value into the current section. The .bcd directive is not valid for the .bss section. .bss The .bss directive changes the current section to .bss. .bss symbol, Define *symbol* in the .bss section and add *integer* bytes to the value of integer the location counter for .bss. When issued with arguments, the .bss directive does not change the current section to .bss. Integer must be positive. The .byte directive generates initialized bytes into the current section. .bvte byte1,byte2,...,byteN The .byte directive is not valid for the .bss section. Each *byte* must be an 8-bit value. .2byte Refer to the description of the .value directive. expression1, expression2, ..., expressionN .4byte Refer to the description of the .long directive. expression1, expression2, ..., expressionN .8byte Refer to the description of the . quad directive. expression1, expression2, ..., expressionN $. \verb|cfi_adjust_cfa_offset| fine to a cfi_adjust_cfa_offset| directive is similar to \\$ OFFSET .cfi def cfa offset directive but *OFFSET* is a relative value that is added or subtracted from the previous offset. OFFSET CFA. The value of the register remains the same, but *OFFSET* is new.

Note that this is the absolute offset that will be added to a defined register to compute the CFA address.

.cfi def cfa REGISTER. **OFFSET**

.cfi escape

.cfi lsda

OFFSET

.cfi_personality

encoding [, exp]

encoding [, exp]

The .cfi def cfa directive, defines a rule to compute CFA. This directive takes address from *REGISTER* and adds *OFFSET* to it.

.cfi_def_cfa_registerThe .cfi def_cfa_register directive, modifies the rule for computing REGISTER CFA. The register in the CFA is set to a new value. The offset remains the same.

.cfi endproc The .cfi endproc directive, is used at the end of a function where it closes its unwind entry previously opened by .cfi startproc and emits it to .eh frame.

The .cfi escape directive, allows you to add arbitrary bytes to the EXPRESSION[,...] unwind information. You can use this directive to add OS-specific CFI opcodes, or generic CFI opcodes that the assembler does not support.

> The .cfi lsda directive, defines LSDA and its encoding. The encoding should be a constant which determines how the LSDA should be encoded. If the value of encoding is 255 (DW_EH_PE_omit), second argument is not present, otherwise second argument should be a constant or a symbol name. The default directive used after .cfi startproc directive is .cfi lsda 0xff.

.cfi offset The .cfi offset directive, saves the previous value of *REGISTER* at REGISTER, offset OFFSET from CFA.

> The .cfi personality directive, defines the personality routine and its encoding. The *encoding* must be a constant which determines how the personality should be encoded. If the value of *encoding* is 255 (DW_EH_PE_omit), second argument is not present, otherwise second argument should be a constant or a symbol name. When you are using indirect encodings, the symbol provided should be the location where personality can be loaded from and not the personality routine itself. The default directive used after .cfi startproc directive is

.cfi personality 0xff. The .cfi register REGISTER1 REGISTER2 directive, saves the previous value of *REGISTER1* in register *REGISTER2*.

In the .cfi rel offset directive, saves the previous value of *REGISTER* at offset *OFFSET* from the current CFA register. This is

.cfi register REGISTER1 REGISTER2

.cfi rel offset REGISTER, OFFSET

transformed to .cfi offset using the known displacement of the CFA register from the CFA. This is often easier to use, because the number will match the code it is annotating.

.cfi_remember_state The .cfi remember state directive, saves all the current rules for all the registers. If the following .cfi * directives is bad, then you can use the .cfi restore state directive to restore the previous saved state.

.cfi_restore REGISTER

The .cfi restore directive, indicates that the rule for register is now the same as it was at the beginning of the function, after all initial instructions added by .cfi_startproc directive are executed.

.cfi_restore_state

The .cfi restore state directive, restores the previous saved state of the register.

.cfi_return_column REGISTER

The .cfi_return_column directive, changes return column REGISTER. The return address is either directly in *REGISTER* or can be accessed by rules for REGISTER.

.cfi same value REGISTER

The .cfi same value directive, indicates the current value of *REGISTER* is the same like in the previous frame and does not require restoration.

.cfi sections section_list

The .cfi sections section_list directive, specifies if CFI directives should emit .eh_frame section and/or .debug_frame section. You can use .eh frame as the section_list to emit .eh frame. You can use the .debug frame as the section_list to emit .debug frame. To emit both use .eh frame and .debug frame as the section_list. By default, .cfi sections emits .eh frame.

.cfi startproc

The .cfi_startproc directive, is used at the beginning of each function that should have an entry in .eh frame. It initializes some internal data structures and emits architecture dependent initial CFI instructions. Each .cfi startproc directive has to be closed by .cfi endproc.

.cfi undefined REGISTER

The .cfi undefined directive, indicates the point from which the previous value of the register cannot be restored.

.comm name, size, alignment The .comm directive allocates storage in the data section. The storage is referenced by the identifier name. Size is measured in bytes and must be a positive integer. *Name* cannot be predefined. *Alignment* is optional. If *alignment* is specified, the address of *name* is aligned to a multiple of alignment.

.data

The .data directive changes the current section to .data.

.double float

The .double directive generates a double-precision floating-point constant into the current section. The .double directive is not valid for the .bss section.

.even

The . even directive aligns the current program counter (.) to an even boundary.

.ext expression1,
expression2, ...,
expressionN

The .ext directive generates an 80387 80—bit floating point constant for each *expression* into the current section. The .ext directive is not valid for the .bss section.

.file "string"

The .file directive creates a symbol table entry where *string* is the symbol name and STT_FILE is the symbol table type. *String* specifies the name of the source file associated with the object file.

.float float

The .float directive generates a single-precision floating-point constant into the current section. The .float directive is not valid in the .bss section.

.globl symbol1, symbol2, ..., symbolN

The .globl directive declares each *symbol* in the list to be *global*. Each symbol is either defined externally or defined in the input file and accessible in other files. Default bindings for the symbol are overridden. A global symbol definition in one file satisfies an undefined reference to the same global symbol in another file. Multiple definitions of a defined global symbol are not allowed. If a defined global symbol has more than one definition, an error occurs. The .globl directive only declares the symbol to be global in scope, it does not define the symbol.

.group group,
section, #comdat

The .group directive adds *section* to a COMDAT *group*. Refer to "COMDAT Section" in *Oracle Solaris 11.3 Linkers and Libraries Guide* for additional information about COMDAT.

.hidden symbol1,
symbol2, ...,
symbolN

The .hidden directive declares each *symbol* in the list to have *hidden* linker scoping. All references to *symbol* within a dynamic module bind to the definition within that module. *Symbol* is not visible outside of the module.

.ident "string"

The .ident directive creates an entry in the .comment section containing *string*. *String* is any sequence of characters, not including the double quote ("). To include the double quote character within a string, precede the double quote character with a backslash (\) (ASCII 0x5C).

.lcomm name, size, alignment

The .lcomm directive allocates storage in the .bss section. The storage is referenced by the symbol *name*, and has a size of *size* bytes. *Name* cannot be predefined, and *size* must be a positive integer. If *alignment* is

If *alignment* is not specified, the default alignment is 4 bytes. .local symbol1, The .local directive declares each *symbol* in the list to be *local*. Each symbol2, ..., symbol is defined in the input file and not accessible to other files. symbolN Default bindings for the symbols are overridden. Symbols declared with the .local directive take precedence over *weak* and *global* symbols. (See"Symbol Table Section" in Oracle Solaris 11.3 Linkers and Libraries Guide for a description of global and weak symbols.) Because local symbols are not accessible to other files, local symbols of the same name may exist in multiple files. The .local directive only declares the symbol to be local in scope, it does not define the symbol. .long expression1, The .long directive generates a long integer (32-bit, two's complement expression2, ..., value) for each expression into the current section. Each expression expressionN must be a 32-bit value and must evaluate to an integer value. The . long directive is not valid for the .bss section. .popsection The .popsection directive pops the top of the section stack and continues processing of the popped section. .previous The .previous directive continues processing of the previous section. .pushsection The .pushsection directive pushes the specified section onto the section section stack and switches to another section. .quad expression1, The . quad directive generates an initialized word (64-bit, two's expression2, ..., complement value) for each *expression* into the current section. Each expressionN expression must be a 64-bit value, and must evaluate to an integer value. The . guad directive is not valid for the .bss section. .rel symbol@type The .rel directive generates the specified relocation entry *type* for the specified symbol. The .lit directive supports TLS (thread-local storage). Refer to Chapter 15, "Thread-Local Storage" in *Oracle Solaris* 11.3 Linkers and Libraries Guide for additional information about TLS. .section section, The .section directive makes section the current section. If section does attributes not exist, a new section with the specified name and attributes is created. If section is a non-reserved section, attributes must be included the first time section is specified by the .section directive. .set symbol, The . set directive assigns the value of *expression* to *symbol*. *Expression* expression can be any legal expression that evaluates to a numerical value. .size symbol, expr Declares the symbol size to be *expr. expr* must be an absolute expression.

specified, the address of *name* is aligned to a multiple of *alignment* bytes.

.skip integer, While generating values for any data section, the .skip directive causes value integer bytes to be skipped over, or, optionally, filled with the specified value. .sleb128 The .sleb128 directive generates a signed, little-endian, base 128 expression number from expression. .string "string" The .string directive places the characters in *string* into the object module at the current location and terminates the string with a null byte (\0). String must be enclosed in double quotes (") (ASCII 0x22). The .string directive is not valid for the .bss section. .symbolic The .symbolic directive declares each *symbol* in the list to have *symbolic* symbol1, symbol2, linker scoping. All references to symbol within a dynamic module bind ..., symbolN to the definition within that module. Outside of the module, *symbol* is treated as global. .thss The .tbss directive changes the current section to .tbss. The .tbss section contains uninitialized TLS data objects that will be initialized to zero by the runtime linker. .tcomm The .tcomm directive defines a TLS common block. .tdata The .tdata directive changes the current section to .tdata. The .tdata section contains the initialization image for initialized TLS data objects. .text The .text directive defines the current section as .text. Declares the type of symbol, where *type* can be: .type symbol[, symbol, ..., symbol], #object #tls_object #function #no_type type[, visibility] and where visibility can be one of: #hidden #protected #eliminate #singleton #exported #internal .uleb128 The .uleb128 directive generates an unsigned, little-endian, base 128 expression number from *expression*. .value The .value directive generates an initialized word (16-bit, two's expression1, complement value) for each expression into the current section. Each expression2, ..., expression must be a 16-bit integer value. The .value directive is not expressionN valid for the .bss section. .weak symbol1, The .weak directive declares each symbol in the argument list to be symbol2, ..., defined either externally or in the input file and accessible to other files. symbolN

Default bindings of the symbol are overridden by the .weak directive. A *weak* symbol definition in one file satisfies an undefined reference to a global symbol of the same name in another file. Unresolved *weak* symbols have a default value of zero. The link editor does not resolve these symbols. If a *weak* symbol has the same name as a defined *global* symbol, the weak symbol is ignored and no error results. The .weak directive does not define the symbol.

.zero expression

While filling a data section, the .zero directive fills the number of bytes specified by *expression* with zero (0).

Instruction Set Mapping

This chapter provides a general mapping between the Oracle Solaris x86 assembly language mnemonics and the Intel or Advanced Micro Devices (AMD) mnemonics. Refer to Table 1, "Instruction References," on page 32 for details on individual processor instructions.

3.1 Instruction Overview

It is beyond the scope of this manual to document the x86 architecture instruction set. This chapter provides a general mapping between the Oracle Solaris x86 assembly language mnemonics and the Intel or AMD mnemonics to enable you to refer to the Intel or AMD documentation for detailed information about a specific instruction. Instructions are listed in tables with the following sections:

- Oracle Solaris mnemonic
- Intel/AMD mnemonic
- Description (short)
- Notes
- Reference

The reference column lists the page number and code for the Intel or AMD manual that documents the instruction. See Table 1, "Instruction References," on page 32 for the codes and links to the associated manuals.

For certain Oracle Solaris mnemonics, the allowed data type suffixes for that mnemonic are indicated in braces ({}) following the mnemonic. For example, bswap{lq} indicates that the following mnemonics are valid: bswap, bswapl (which is the default and equivalent to bswap), and bswapq. See "2.2.1 Instructions" on page 21 for information on data type suffixes.

TABLE 1 Instruction References

Manual Code	Name of the Document	Volume	Link
253666-048US/Sep.2013	Intel 64 and IA-32 Architectures Software Developer's Manual	2A	Instruction Set Reference, A-M

To locate a specific Oracle Solaris x86 mnemonic, look up the mnemonic in the index.

3.2 General-Purpose Instructions

The general-purpose instructions perform basic data movement, memory addressing, arithmetic and logical operations, program flow control, input/output, and string operations on integer, pointer, and BCD data types.

3.2.1 Data Transfer Instructions

The data transfer instructions move data between memory and the general-purpose and segment registers, and perform operations such as conditional moves, stack access, and data conversion.

TABLE 2 Data Transfer Instructions

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
bswap{lq}	BSWAP	byte swap	bswapq valid only under -m64
cbtw	CBW	convert byte to word	
cltd	CDQ	convert doubleword to quadword	%eax → %edx:%eax

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
cltq	CDQE	convert doubleword to quadword	%eax → %rax
<pre>cmova{wlq}, cmov {wlq}.a</pre>	CMOVA	conditional move if above	cltq valid only under -m64 cmovaq valid only under -m64
<pre>cmovae{wlq}, cmov {wlq}.ae</pre>	CMOVAE	conditional move if above or equal	cmovaeq valid only under -m64
<pre>cmovb{wlq}, cmov {wlq}.b</pre>	CMOVB	conditional move if below	cmovbq valid only under -m64
<pre>cmovbe{wlq}, cmov {wlq}.be</pre>	CMOVBE	conditional move if below or equal	cmovbeq valid only under -m64
<pre>cmovc{wlq}, cmov {wlq}.c</pre>	CMOVC	conditional move if carry	cmovcq valid only under -m64
<pre>cmove{wlq}, cmov {wlq}.e</pre>	CMOVE	conditional move if equal	cmoveq valid only under -m64
<pre>cmovg{wlq}, cmov {wlq}.g</pre>	CMOVG	conditional move if greater	cmovgq valid only under -m64
<pre>cmovge{wlq}, cmov {wlq}.ge</pre>	CMOVGE	conditional move if greater or equal	cmovgeq valid only under -m64
<pre>cmovl{wlq}, cmov {wlq}.l</pre>	CMOVL	conditional move if less	cmovlq valid only under
<pre>cmovle{wlq}, cmov {wlq}.le</pre>	COMVLE	conditional move if less or equal	cmovleq valid only under -m64
cmovna{wlq}, cmov {wlq}.na	CMOVNA	conditional move if not above	cmovnaq valid only under -m64
<pre>cmovnae{wlq}, cmov {wlq}.nae</pre>	CMOVNAE	conditional move if not above or equal	cmovnaeq valid only under -m64
<pre>cmovnb{wlq}, cmov {wlq}.nb</pre>	CMOVNB	conditional move if not below	cmovnbq valid only under -m64
<pre>cmovnbe{wlq}, cmov {wlq}.nbe</pre>	CMOVNBE	conditional move if not below or equal	cmovnbeq valid only under -m64
<pre>cmovnc{wlq}, cmov {wlq}.nc</pre>	CMOVNC	conditional move if not carry	cmovncq valid only under -m64
<pre>cmovne{wlq}, cmov {wlq}.ne</pre>	CMOVNE	conditional move if not equal	cmovneq valid only under -m64
<pre>cmovng{wlq}, cmov {wlq}.ng</pre>	CMOVNG	conditional move if greater	cmovngq valid only under -m64
<pre>cmovnge{wlq}, cmov {wlq}.nge</pre>	CMOVNGE	conditional move if not greater or equal	cmovngeq valid only under -m64
<pre>cmovnl{wlq}, cmov {wlq}.nl</pre>	CMOVNL	conditional move if not less	cmovnlq valid only under -m64
<pre>cmovnle{wlq}, cmov {wlq}.nle</pre>	CMOVNLE	conditional move if not above or equal	cmovnleq valid only under -m64

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
<pre>cmovno{wlq}, cmov {wlq}.no</pre>	CMOVNO	conditional move if not overflow	cmovnoq valid only under -m64
<pre>cmovnp{wlq}, cmov {wlq}.np</pre>	CMOVNP	conditional move if not parity	cmovnpq valid only under -m64
<pre>cmovns{wlq}, cmov {wlq}.ns</pre>	CMOVNS	conditional move if not sign (non-negative)	cmovnsq valid only under -m64
<pre>cmovnz{wlq}, cmov {wlq}.nz</pre>	CMOVNZ	conditional move if not zero	cmovnzq valid only under -m64
<pre>cmovo{wlq}, cmov {wlq}.o</pre>	CMOVO	conditional move if overflow	cmovoq valid only under -m64
<pre>cmovp{wlq}, cmov {wlq}.p</pre>	CMOVP	conditional move if parity	cmovpq valid only under -m64
<pre>cmovpe{wlq}, cmov{wlq}. pe</pre>	CMOVPE	conditional move if parity even	cmovpeq valid only under -m64
<pre>cmovpo{wlq}, cmov{wlq}. po</pre>	CMOVPO	conditional move if parity odd	cmovpoq valid only under -m64
<pre>cmovs{wlq}, cmov{wlq}.s</pre>	CMOVS	conditional move if sign (negative)	cmovsq valid only under -m64
<pre>cmovz{wlq}, cmov{wlq}.z</pre>	CMOVZ	conditional move if zero	cmovzq valid only under -m64
cmpxchg{bwlq}	CMPXCHG	compare and exchange	cmpxchgq valid only under -m64
cmpxchg8b	CMPXCHG8B	compare and exchange 8 bytes	
cqtd	CQO	convert quadword to octword	%rax → %rdx:%rax cqtd valid only under -m64
cqto	CQO	convert quadword to octword	%rax → %rdx:%rax cqto valid only under -m64
cwtd	CWD	convert word to doubleword	%ax → %dx:%ax
cwtl	CWDE	convert word to doubleword in %eax register	%ax → %eax
invpcid	INVPCID	Invalidate Process-Context Identifier	page 3-416 (253666- 048US/Sep.2013)
mov{bwlq}	MOV	move data between immediate values, general purpose registers, segment registers, and memory	movq valid only under -m64
movabs{bwlq}	MOVABS	move immediate value to register	movabs valid only under -m64
movabs{bwlq}A	MOVABS	move immediate value to register {AL, AX, GAX, RAX}	movabs valid only under -m64

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
<pre>movsb{wlq}, movsw{lq}</pre>	MOVSX	move and sign extend	movsbq and movswq valid only under -m64
<pre>movzb{wlq}, movzw{lq}</pre>	MOVZX	move and zero extend	movzbq and movzwq valid only under -m64
pop{wlq}	POP	pop stack	popq valid only under -m64
popaw	POPA	pop general-purpose registers from stack	popaw invalid under -m64
popal, popa	POPAD	pop general-purpose registers from stack	invalid under -m64
push{wlq}	PUSH	push onto stack	pushq valid only under -m64
pushaw	PUSHA	push general-purpose registers onto stack	pushaw invalid under -m64
pushal, pusha	PUSHAD	push general-purpose registers onto stack	invalid under -m64
xadd{bwlq}	XADD	exchange and add	xaddq valid only under -m64
xchg{bwlq}	XCHG	exchange	xchgq valid only under -m64
xchg{bwlq}A	XCHG	exchange	xchgqA valid only under -m64

3.2.2 Binary Arithmetic Instructions

The binary arithmetic instructions perform basic integer computions on operands in memory or the general-purpose registers.

TABLE 3 Binary Arithmetic Instructions

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
adc{bwlq}	ADC	add with carry	adcq valid only under -m64
add{bwlq}	ADD	integer add	addq valid only under -m64
cmp{bwlq}	CMP	compare	cmpq valid only under -m64
dec{bwlq}	DEC	decrement	decq valid only under -m64
div{bwlq}	DIV	divide (unsigned)	divq valid only under -m64
idiv{bwlq}	IDIV	divide (signed)	idivq valid only under -m64
imul{bwlq}	IMUL	multiply (signed)	imulq valid only under -m64
inc{bwlq}	INC	increment	incq valid only under -m64
mul{bwlq}	MUL	multiply (unsigned)	mulq valid only under -m64

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
neg{bwlq}	NEG	negate	negq valid only under -m64
sbb{bwlq}	SBB	subtract with borrow	sbbq valid only under -m64
sub{bwlq}	SUB	subtract	subq valid only under -m64

3.2.3 Decimal Arithmetic Instructions

The decimal arithmetic instructions perform decimal arithmetic on binary coded decimal (BCD) data.

TABLE 4 Decimal Arithmetic Instructions

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
aaa	AAA	ASCII adjust after addition	invalid under -m64
aad	AAD	ASCII adjust before division	invalid under -m64
aam	AAM	ASCII adjust after multiplication	invalid under -m64
aas	AAS	ASCII adjust after subtraction	invalid under -m64
daa	DAA	decimal adjust after addition	invalid under -m64
das	DAS	decimal adjust after subtraction	invalid under -m64

3.2.4 Logical Instructions

The logical instructions perform basic logical operations on their operands.

TABLE 5 Logical Instructions

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
and{bwlq}	AND	bitwise logical AND	andq valid only under -m64
not{bwlq}	NOT	bitwise logical NOT	notq valid only under -m64
or{bwlq}	OR	bitwise logical OR	orq valid only under -m64
xor{bwlq}	XOR	bitwise logical exclusive OR	xorq valid only under -m64

3.2.5 Shift and Rotate Instructions

The shift and rotate instructions shift and rotate the bits in their operands.

TABLE 6 Shift and Rotate Instructions

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
rcl{bwlq}	RCL	rotate through carry left	rclq valid only under -m64
rcr{bwlq}	RCR	rotate through carry right	rcrq valid only under -m64
rol{bwlq}	ROL	rotate left	rolq valid only under -m64
ror{bwlq}	ROR	rotate right	rorq valid only under -m64
sal{bwlq}	SAL	shift arithmetic left	salq valid only under -m64
sar{bwlq}	SAR	shift arithmetic right	sarq valid only under -m64
shl{bwlq}	SHL	shift logical left	shlq valid only under -m64
shld{bwlq}	SHLD	shift left double	shldq valid only under -m64
shr{bwlq}	SHR	shift logical right	shrq valid only under -m64
shrd{bwlq}	SHRD	shift right double	shrdq valid only under -m64

3.2.6 Bit and Byte Instructions

The bit instructions test and modify individual bits in operands. The byte instructions set the value of a byte operand to indicate the status of flags in the %eflags register.

TABLE 7 Bit and Byte Instructions

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
bsf{wlq}	BSF	bit scan forward	bsfq valid only under -m64
bsr{wlq}	BSR	bit scan reverse	bsrq valid only under -m64
bt{wlq}	ВТ	bit test	btq valid only under -m64
btc{wlq}	втс	bit test and complement	btcq valid only under -m64
btr{wlq}	BTR	bit test and reset	btrq valid only under -m64
bts{wlq}	BTS	bit test and set	btsq valid only under -m64
seta	SETA	set byte if above	
setae	SETAE	set byte if above or equal	
setb	SETB	set byte if below	
setbe	SETBE	set byte if below or equal	
setc	SETC	set byte if carry	
sete	SETE	set byte if equal	
setg	SETG	set byte if greater	
setge	SETGE	set byte if greater or equal	
setl	SETL	set byte if less	
setle	SETLE	set byte if less or equal	

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
setna	SETNA	set byte if not above	
setnae	SETNAE	set byte if not above or equal	
setnb	SETNB	set byte if not below	
setnbe	SETNBE	set byte if not below or equal	
setnc	SETNC	set byte if not carry	
setne	SETNE	set byte if not equal	
setng	SETNG	set byte if not greater	
setnge	SETNGE	set byte if not greater or equal	
setnl	SETNL	set byte if not less	
setnle	SETNLE	set byte if not less or equal	
setno	SETNO	set byte if not overflow	
setnp	SETNP	set byte if not parity	
setns	SETNS	set byte if not sign (non- negative)	
setnz	SETNZ	set byte if not zero	
seto	SETO	set byte if overflow	
setp	SETP	set byte if parity	
setpe	SETPE	set byte if parity even	
setpo	SETP0	set byte if parity odd	
sets	SETS	set byte if sign (negative)	
setz	SETZ	set byte if zero	
test{bwlq}	TEST	logical compare	testq valid only under -m64

3.2.7 Control Transfer Instructions

The control transfer instructions control the flow of program execution.

TABLE 8 Control Transfer Instructions

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
bound{wl}	BOUND	detect value out of range	boundw invalid under -m64
call	CALL	call procedure	
enter	ENTER	high-level procedure entry	
int	INT	software interrupt	
into	INTO	interrupt on overflow	invalid under -m64

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
iret	IRET	return from interrupt	
ja	JA	jump if above	
jae	JAE	jump if above or equal	
jb	JB	jump if below	
jbe	JBE	jump if below or equal	
jc	JC	jump if carry	
jcxz	JCXZ	jump register %cx zero	
je	JE	jump if equal	
jecxz	JECXZ	jump register %ecx zero	invalid under -m64
jg	JG	jump if greater	
jge	JGE	jump if greater or equal	
jl	JL	jump if less	
jle	JLE	jump if less or equal	
jmp	ЈМР	jump	
jnae	JNAE	jump if not above or equal	
jnb	JNB	jump if not below	
jnbe	JNBE	jump if not below or equal	
jnc	JNC	jump if not carry	
jne	JNE	jump if not equal	
jng	JNG	jump if not greater	
jnge	JNGE	jump if not greater or equal	
jnl	JNL	jump if not less	
jnle	JNLE	jump if not less or equal	
jno	JNO	jump if not overflow	
jnp	JNP	jump if not parity	
jns	JNS	jump if not sign (non- negative)	
jnz	JNZ	jump if not zero	
jo	J0	jump if overflow	
jp	JP	jump if parity	
јре	JPE	jump if parity even	
јро	JP0	jump if parity odd	
js	JS	jump if sign (negative)	
jz	JZ	jump if zero	
lcall	CALL	call far procedure	valid as indirect only for -m64
leave	LEAVE	high-level procedure exit	

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
loop	LOOP	loop with %ecx counter	
loope	LOOPE	loop with %ecx and equal	
loopne	LOOPNE	loop with %ecx and not equal	
loopnz	LOOPNZ	loop with %ecx and not zero	
loopz	L00PZ	loop with %ecx and zero	
lret	RET	return from far procedure	valid as indirect only for m64
ret	RET	return	

3.2.8 String Instructions

The string instructions operate on strings of bytes. Operations include storing strings in memory, loading strings from memory, comparing strings, and scanning strings for substrings.

Note - The Oracle Solaris mnemonics for certain instructions differ slightly from the Intel/AMD mnemonics. Alphabetization of the table below is by the Oracle Solaris mnemonic. All string operations default to long (doubleword).

TABLE 9 String Instructions

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
cmps{q}	CMPS	compare string	cmpsq valid only under -m64
cmpsb	CMPSB	compare byte string	
cmpsl	CMPSD	compare doubleword string	
cmpsw	CMPSW	compare word string	
lods{q}	LODS	load string	lodsq valid only under -m64
lodsb	LODSB	load byte string	
lodsl	LODSD	load doubleword string	
lodsw	LODSW	load word string	
movs{q}	MOVS	move string	movsq valid only under -m64
movsb	MOVSB	move byte string	movsb is not movsb {wlq}. See Table 2, "Data Transfer Instructions," on page 33
movsl, smovl	MOVSD	move doubleword string	

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
movsw, smovw	MOVSW	move word string	movsw is not movsw {lq}. See Table 2, "Data Transfer Instructions," on page 33
rep	REP	repeat while %ecx not zero	
repnz	REPNE	repeat while not equal	
repnz	REPNZ	repeat while not zero	
repz	REPE	repeat while equal	
repz	REPZ	repeat while zero	
scas{q}	SCAS	scan string	scasq valid only under -m64
scasb	SCASB	scan byte string	
scasl	SCASD	scan doubleword string	
scasw	SCASW	scan word string	
stos{q}	ST0S	store string	stosq valid only under -m64
stosb	STOSB	store byte string	
stosl	STOSD	store doubleword string	
stosw	STOSW	store word string	

3.2.9 I/O Instructions

The input/output instructions transfer data between the processor's I/O ports, registers, and memory.

TABLE 10 I/O Instructions

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
in	IN	read from a port	
ins	INS	input string from a port	
insb	INSB	input byte string from port	
insl	INSD	input doubleword string from port	
insw	INSW	input word string from port	
out	OUT	write to a port	
outs	OUTS	output string to port	
outsb	OUTSB	output byte string to port	
outsl	OUTSD	output doubleword string to port	
outsw	OUTSW	output word string to port	

3.2.10 Flag Control (EFLAG) Instructions

The status flag control instructions operate on the bits in the %eflags register.

TABLE 11 Flag Control Instructions

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
clc	CLC	clear carry flag	
cld	CLD	clear direction flag	
cli	CLI	clear interrupt flag	
cmc	CMC	complement carry flag	
lahf	LAHF	load flags into %ah register	
popfw	POPF	pop %eflags from stack	
popf{lq}	POPFL	pop %eflags from stack	popfq valid only under -m64
pushfw	PUSHF	push %eflags onto stack	
pushf{lq}	PUSHFL	push %eflags onto stack	pushfq valid only under -m64
sahf	SAHF	store %ah register into flags	
stc	STC	set carry flag	
std	STD	set direction flag	
sti	STI	set interrupt flag	

3.2.11 Segment Register Instructions

The segment register instructions load far pointers (segment addresses) into the segment registers.

TABLE 12 Segment Register Instructions

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
lds{wl}	LDS	load far pointer using %ds	ldsl and ldsw invalid under -m64
les{wl}	LES	load far pointer using %es	lesl and lesw invalid under -m64
lfs{wl}	LFS	load far pointer using %fs	
lgs{wl}	LGS	load far pointer using %gs	
lss{wl}	LSS	load far pointer using %ss	

3.2.12 Miscellaneous Instructions

The instructions documented in this section provide a number of useful functions.

TABLE 13 Miscellaneous Instructions

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
cpuid	CPUID	processor identification	
lea{wlq}	LEA	load effective address	leaq valid only under -m64
nop	NOP	no operation	
ud2	UD2	undefined instruction	
xlat	XLAT	table lookup translation	
xlatb	XLATB	table lookup translation	

3.3 Floating-Point Instructions

The floating point instructions operate on floating-point, integer, and binary coded decimal (BCD) operands.

3.3.1 Data Transfer Instructions (Floating Point)

The data transfer instructions move floating-point, integer, and BCD values between memory and the floating point registers.

TABLE 14 Data Transfer Instructions (Floating-Point)

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
fbld	FBLD	load BCD	
fbstp	FBSTP	store BCD and pop	
fcmovb	FCMOVB	floating-point conditional move if below	
fcmovbe	FCMOVBE	floating-point conditional move if below or equal	
fcmove	FCMOVE	floating-point conditional move if equal	
fcmovnb	FCMOVNB	floating-point conditional move if not below	
fcmovnbe	FCMOVNBE	floating-point conditional move if not below or equal	

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
fcmovne	FCMOVNE	floating-point conditional move if not equal	
fcmovnu	FCMOVNU	floating-point conditional move if unordered	
fcmovu	FCMOVU	floating-point conditional move if unordered	
fild	FILD	load integer	
fist	FIST	store integer	
fistp	FISTP	store integer and pop	
fld	FLD	load floating-point value	
fst	FST	store floating-point value	
fstp	FSTP	store floating-point value and pop	
fxch	FXCH	exchange registers	

3.3.2 Basic Arithmetic Instructions (Floating-Point)

The basic arithmetic instructions perform basic arithmetic operations on floating-point and integer operands.

TABLE 15 Basic Arithmetic Instructions (Floating-Point)

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
fabs	FABS	absolute value	
fadd	FADD	add floating-point	
faddp	FADDP	add floating-point and pop	
fchs	FCHS	change sign	
fdiv	FDIV	divide floating-point	
fdivp	FDIVP	divide floating-point and pop	
fdivr	FDIVR	divide floating-point reverse	
fdivrp	FDIVRP	divide floating-point reverse and pop	
fiadd	FIADD	add integer	
fidiv	FIDIV	divide integer	
fidivr	FIDIVR	divide integer reverse	
fimul	FIMUL	multiply integer	
fisub	FISUB	subtract integer	
fisubr	FISUBR	subtract integer reverse	

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
fmul	FMUL	multiply floating-point	
fmulp	FMULP	multiply floating-point and pop	
fprem	FPREM	partial remainder	
fprem1	FPREM1	IEEE partial remainder	
frndint	FRNDINT	round to integer	
fscale	FSCALE	scale by power of two	
fsqrt	FSQRT	square root	
fsub	FSUB	subtract floating-point	
fsubp	FSUBP	subtract floating-point and pop	
fsubr	FSUBR	subtract floating-point reverse	
fsubrp	FSUBRP	subtract floating-point reverse and pop	
fxtract	FXTRACT	extract exponent and significand	

3.3.3 Comparison Instructions (Floating-Point)

The floating-point comparison instructions operate on floating-point or integer operands.

TABLE 16 Comparison Instructions (Floating-Point)

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
fcom	FCOM	compare floating-point	
fcomi	FCOMI	compare floating-point and set %eflags	
fcomip	FCOMIP	compare floating-point, set %eflags, and pop	
fcomp	FCOMP	compare floating-point and pop	
fcompp	FCOMPP	compare floating-point and pop twice	
ficom	FICOM	compare integer	
ficomp	FICOMP	compare integer and pop	
ftst	FTST	test floating-point (compare with 0.0)	
fucom	FUCOM	unordered compare floating-point	

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
fucomi	FUCOMI	unordered compare floating-point and set %eflags	
fucomip	FUCOMIP	unordered compare floating-point, set %eflags, and pop	
fucomp	FUCOMP	unordered compare floating-point and pop	
fucompp	FUCOMPP	compare floating-point and pop twice	
fxam	FXAM	examine floating-point	

3.3.4 Transcendental Instructions (Floating-Point)

The transcendental instructions perform trigonometric and logarithmic operations on floating-point operands.

TABLE 17 Transcendental Instructions (Floating-Point)

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
f2xm1	F2XM1	computes 2 ^x -1	
fcos	FCOS	cosine	
fpatan	FPATAN	partial arctangent	
fptan	FPTAN	partial tangent	
fsin	FSIN	sine	
fsincos	FSINCOS	sine and cosine	
fyl2x	FYL2X	computes y * log ₂ x	
fyl2xp1	FYL2XP1	computes y * log ₂ (x+1)	

3.3.5 Load Constants (Floating-Point) Instructions

The load constants instructions load common constants, such as π , into the floating-point registers.

TABLE 18 Load Constants Instructions (Floating-Point)

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
fld1	FLD1	load +1.0	
fldl2e	FLDL2E	load log ₂ e	
fldl2t	FLDL2T	load log ₂ 10	

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
fldlg2	FLDLG2	load log ₁₀ 2	
fldln2	FLDLN2	load log _e 2	
fldpi	FLDPI	load π	
fldz	FLDZ	load +0.0	

3.3.6 Control Instructions (Floating-Point)

The floating-point control instructions operate on the floating-point register stack and save and restore the floating-point state.

TABLE 19 Control Instructions (Floating-Point)

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
fclex	FCLEX	clear floating-point exception flags after checking for error conditions	
fdecstp	FDECSTP	decrement floating-point register stack pointer	
ffree	FFREE	free floating-point register	
fincstp	FINCSTP	increment floating-point register stack pointer	
finit	FINIT	initialize floating-point unit after checking error conditions	
fldcw	FLDCW	load floating-point unit control word	
fldenv	FLDENV	load floating-point unit environment	
fnclex	FNCLEX	clear floating-point exception flags without checking for error conditions	
fninit	FNINIT	initialize floating-point unit without checking error conditions	
fnop	FNOP	floating-point no operation	
fnsave	FNSAVE	save floating-point unit state without checking error conditions	
fnstcw	FNSTCW	store floating-point unit control word without checking error conditions	

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
fnstenv	FNSTENV	store floating-point unit environment without checking error conditions	
fnstsw	FNSTSW	store floating-point unit status word without checking error conditions	
frstor	FRSTOR	restore floating-point unit state	
fsave	FSAVE	save floating-point unit state after checking error conditions	
fstcw	FSTCW	store floating-point unit control word after checking error conditions	
fstenv	FSTENV	store floating-point unit environment after checking error conditions	
fstsw	FSTSW	store floating-point unit status word after checking error conditions	
fwait	FWAIT	wait for floating-point unit	
wait	WAIT	wait for floating-point unit	

3.4 SIMD State Management Instructions

The fxsave and fxrstor instructions save and restore the state of the floating-point unit and the MMX, XMM, and MXCSR registers.

TABLE 20 SIMD State Management Instructions

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
fxrstor	FXRSTOR	restore floating-point unit and SIMD state	
fxsave	FXSAVE	save floating-point unit and SIMD state	

3.5 ADX Instructions

TABLE 21 ADX Instructions

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Reference
adcx	ADCX	Unsigned Integer Addition of Two Operands With Carry Flag	page 93-94 (325383- 053US/Jan.2015)
adox	ADOX	Unsigned Integer Addition of Two Operands With Overflow Flag	page 108-109 (325383- 053US/Jan.2015)

3.6 AES Instructions

TABLE 22 AES Instructions

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Reference
aesdec	AESDEC	Perform One Round of an AES Decryption Flow	page 3-40 (253666-048US/ Sep.2013)
aesdeclast	AESDECLAST	Perform Last Round of an AES Decryption Flow	page 3-42 (253666-048US/ Sep.2013)
aesenc	AESENC	Perform One Round of an AES Encryption Flow	page 3-44 (253666-048US/ Sep.2013)
aesenclast	AESENCLAST	Perform Last Round of an AES Encryption Flow	page 3-46 (253666-048US/ Sep.2013)
aesimc	AESIMC	Perform the AES InvMixColumn Transformation	page 3-48 (253666-048US/ Sep.2013)
aeskeygenassist	AESKEYGENASSIST	AES Round Key Generation Assist	page 3-49 (253666-048US/ Sep.2013)

3.6.1 Advanced Vector Extensions of AES Instructions

 TABLE 23
 Advanced Vector Extensions of AES Instructions

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Reference
vaesdec	AESDEC	Perform One Round of an AES Decryption Flow	page 3-40 (253666-048US/ Sep.2013)
vaesdeclast	AESDECLAST	Perform Last Round of an AES Decryption Flow	page 3-42 (253666-048US/ Sep.2013)

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Reference
vaesenc	AESENC	Perform One Round of an AES Encryption Flow	page 3-44 (253666-048US/ Sep.2013)
vaesenclast	AESENCLAST	Perform Last Round of an AES Encryption Flow	page 3-46 (253666-048US/ Sep.2013)
vaesimc	AESIMC	Perform the AES InvMixColumn Transformation	page 3-48 (253666-048US/ Sep.2013)
vaeskeygenassist	AESKEYGENASSIST	AES Round Key Generation Assist	page 3-49 (253666-048US/ Sep.2013)

3.7 AVX Instructions

TABLE 24 AVX Instructions

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Reference
vaddpd	ADDPD	Add Packed Double- Precision Floating-Point Values	page 5-7 (319433- 016/Oct.2013)

vcmpunordss	CMPSS	Compare Scalar Single- Precision Floating-Point Value	page 5-57 (319433-016/Oct. 2013)
vcomisd	COMISD	Compare Scalar Ordered Double-Precision Floating- Point Values and Set EFLAGS	page 5-62 (319433-016/Oct. 2013)
vcomiss	COMISS	Compare Scalar Ordered Single-Precision Floating- Point Values and Set EFLAGS	page 5-64 (319433-016/Oct. 2013)
vcvtdq2pd	CVTDQ2PD	Convert Packed Doubleword Integers to Packed Double-Precision Floating-Point Values	page 5-79 (319433-016/Oct. 2013)
vcvtdq2ps	CVTDQ2PS	Convert Packed Doubleword Integers to Packed Single-Precision Floating-Point Values	page 5-82 (319433-016/Oct. 2013)
vcvtpd2dq(x y)	CVTPD2DQ	Convert Packed Double- Precision Floating- Point Values to Packed Doubleword Integers	page 5-85 (319433-016/Oct. 2013)
vcvtpd2ps(x y)	CVTPD2PS	Convert Packed Double- Precision Floating-Point Values to Packed Single- Precision Floating-Point Values5-88(319433-016/ Oct.2013)	page 5-88 (319433-016/Oct. 2013)

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Reference
vcvtps2dq	CVTPS2DQ	Convert Packed Single- Precision Floating-Point Values to Packed Signed Doubleword Integer Values	page 5-100 (319433-016/Oct. 2013)
vcvtps2pd	CVTPS2PD	Convert Packed Single- Precision Floating-Point Values to Packed Double- Precision Floating-Point	page (319433- 016/Oct.2013)
vcvtsd2si(q l)	CVTSD2SI	Convert Scalar Double- Precision Floating-Point Value to Doubleword Integer	page 5-108 (319433-016/Oct. 2013)
vcvtsd2ss	CVTSD2SS	Convert Scalar Double- Precision Floating-Point Value to Scalar Single- Precision Floating-Point Value	page 5-112 (319433-016/Oct. 2013)
vcvtsi2sd(q l)	CVTSI2SD	Convert Doubleword Integer to Scalar Double- Precision Floating-Point Value	page 5-114 (319433-016/Oct. 2013)
vcvtsi2ss(q l)	CVTSI2SS	Convert Doubleword Integer to Scalar Single- Precision Floating-Point Value	page 5-116 (319433-016/Oct. 2013)
vcvtss2sd	CVTSS2SD	Convert Scalar Single- Precision Floating-Point Value to Scalar Double- Precision Floating-Point Value	page 5-118 (319433-016/Oct. 2013)
vcvtss2si(q l)	CVTSS2SI	Convert Scalar Single- Precision Floating-Point Value to Doubleword Integer	page 5-120 (319433-016/Oct. 2013)
vcvttpd2dq(x y)	CVTTPD2DQ	Convert with Truncation Packed Double-Precision Floating-Point Values to Packed Doubleword	page (319433- 016/Oct.2013)
vcvttps2dq	CVTTPS2DQ	Convert with Truncation Packed Single-Precision Floating-Point Values to Packed Signed Doubleword	page (319433- 016/Oct.2013)
vcvttsd2si(q l)	CVTTSD2SI	Convert with Truncation Scalar Double-Precision Floating-Point Value to Signed Integer	page 5-134 (319433-016/Oct. 2013)
vcvttss2si(q l)	CVTTSS2SI	Convert with Truncation Scalar Single-Precision Floating-Point Value to Integer	page 5-137 (319433-016/Oct. 2013)

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Reference
vdivpd	DIVPD	Divide Packed Double- Precision Floating-Point Values	page 5-66 (319433-016/Oct. 2013)
vdivps	DIVPS	Divide Packed Single- Precision Floating-Point Values	page 5-68 (319433-016/Oct. 2013)
vdivsd	DIVSD	Divide Scalar Double- Precision Floating-Point Value	page 5-71 (319433-016/Oct. 2013)
vdivss	DIVSS	Divide Scalar Single- Precision Floating-Point Values	page 5-73 (319433-016/Oct. 2013)
vdppd	DPPD	Dot Product of Packed Double Precision Floating- Point Values	page 3-240 (253666-048US/ Sep.2013)
vdpps	DPPS	Dot Product of Packed Single Precision Floating- Point Values	page 3-242 (253666-048US/ Sep.2013)
vextractps	EXTRACTPS	Extract Packed Floating- Point Values	page 5-158 (319433-016/Oct. 2013)
vhaddpd	HADDPD	Packed Double-FP Horizontal Add	page 3-370 (253666-048US/ Sep.2013)
vhaddps	HADDPS	Packed Single-FP Horizontal Add	page 3-373 (253666-048US/ Sep.2013)
vhsubpd	HSUBPD	Packed Double-FP Horizontal Subtract	page 3-377 (253666-048US/ Sep.2013)
vhsubps	HSUBPS	Packed Single-FP Horizontal Subtract	page 3-380 (253666-048US/ Sep.2013)
vinsertps	INSERTPS	Insert Scalar Single- Precision Floating-Point Value	page 5-311 (319433-016/Oct. 2013)
vlddqu	LDDQU	Load Unaligned Integer 128 Bits	page 3-444 (253666-048US/ Sep.2013)
vldmxcsr	LDMXCSR	Load MXCSR Register	page 3-446 (253666-048US/ Sep.2013)
vmaskmovdqu	MASKMOVDQU	Store Selected Bytes of Double Quadword	page 3-478 (253666-048US/ Sep.2013)
vmaxpd	MAXPD	Maximum of Packed Double-Precision Floating- Point Values	page 5-314 (319433-016/Oct. 2013)

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Reference
vmaxps	MAXPS	Maximum of Packed Single-Precision Floating- Point Values	page 5-317 (319433-016/Oct. 2013)
vmaxsd	MAXSD	Return Maximum Scalar Double-Precision Floating- Point Value	page 5-320 (319433-016/Oct. 2013)
vmaxss	MAXSS	Return Maximum Scalar Single-Precision Floating- Point Value	page 5-322 (319433-016/Oct. 2013)
vminpd	MINPD	Minimum of Packed Double-Precision Floating- Point Values	page 5-324 (319433-016/Oct. 2013)
vminps	MINPS	Minimum of Packed Single- Precision Floating-Point Values	page 5-327 (319433-016/Oct. 2013)
vminsd	MINSD	Return Minimum Scalar Double-Precision Floating- Point Value	page 5-330 (319433-016/Oct. 2013)
vminss	MINSS	Return Minimum Scalar Single-Precision Floating- Point Value	page 5-332 (319433-016/Oct. 2013)
vmovapd	MOVAPD	Move Aligned Packed Double-Precision Floating- Point Values	page 5-334 (319433-016/Oct. 2013)
vmovaps	MOVAPS	Move Aligned Packed Single-Precision Floating- Point Values	page 5-337 (319433-016/Oct. 2013)
vmov(q d)	MOVDMOVQ	Move Doubleword and Quadword	page 5-340 (319433-016/Oct. 2013)
vmovddup	MOVDDUP	Replicate Double FP Values	page 5-346 (319433-016/Oct. 2013)
vmovdqa	MOVDQA	Move Aligned Packed Integer Values	page 5-349 (319433-016/Oct. 2013)
vmovdqu	MOVDQU VMOVDQU32 VMOVDQU64	Move Unaligned Packed Integer Values	page 5-353 (319433-016/Oct. 2013)
vmovhlps	MOVHLPS	Move Packed Single- Precision Floating-Point Values High to Low	page 5-357 (319433-016/Oct. 2013)
vmovhpd	MOVHPD	Move High Packed Double- Precision Floating-Point Values	page 5-359 (319433-016/Oct. 2013)

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Reference
vmovhps	MOVHPS	Move High Packed Single- Precision Floating-Point Values	page 5-361 (319433-016/Oct. 2013)
vmovlhps	MOVLHPS	Move Packed Single- Precision Floating-Point Values Low to High	page 5-363 (319433-016/Oct. 2013)
vmovlpd	MOVLPD	Move Low Packed Double- Precision Floating-Point Values	page 5-365 (319433-016/Oct. 2013)
vmovlps	MOVLPS	Move Low Packed Single- Precision Floating-Point Values	page 5-367 (319433-016/Oct. 2013)
vmovmskpd	MOVMSKPD	Extract Packed Double- Precision Floating-Point Sign Mask	page 3-539 (253666-048US/ Sep.2013)
vmovmskps	MOVMSKPS	Extract Packed Single- Precision Floating-Point Sign Mask	page 3-541 (253666-048US/ Sep.2013)
vmovntdq	MOVNTDQ	Store Packed Integers Using Non-Temporal Hint	page 5-371 (319433-016/Oct. 2013)
vmovntdqa	MOVNTDQA	Load Double Quadword Non-Temporal Aligned Hint	page 5-369 (319433-016/Oct. 2013)
vmovntpd	MOVNTPD	Store Packed Double- Precision Floating- Point Values Using Non- Temporal Hint	page 5-373 (319433-016/Oct. 2013)
vmovntps	MOVNTPS	Store Packed Single- Precision Floating- Point Values Using Non- Temporal Hint	page 5-375 (319433-016/Oct. 2013)
vmovq	MOVQ	Move Quadword	page 5-343 (319433-016/Oct. 2013)
vmovsd	MOVSD	Move or Merge Scalar Double-Precision Floating- Point Value	page 5-377 (319433-016/Oct. 2013)
vmovshdup	MOVSHDUP	Replicate Single FP Values	page 5-380 (319433-016/Oct. 2013)
vmovsldup	MOVSLDUP	Replicate Single FP Values	page 5-383 (319433-016/Oct. 2013)
vmovss	MOVSS	Move or Merge Scalar Single-Precision Floating- Point Value	page 5-386 (319433-016/Oct. 2013)

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Reference
vmovupd	MOVUPD	Move Unaligned Packed Double-Precision Floating- Point Values	page 5-389 (319433-016/Oct. 2013)
vmovups	MOVUPS	Move Unaligned Packed Single-Precision Floating- Point Values	page 5-392 (319433-016/Oct. 2013)
vmpsadbw	MPSADBW	Compute Multiple Packed Sums of Absolute Difference	page 3-577 (253666-048US/ Sep.2013)
vmulpd	MULPD	Multiply Packed Double- Precision Floating-Point Values	page 5-395 (319433-016/Oct. 2013)
vmulps	MULPS	Multiply Packed Single- Precision Floating-Point Values	page 5-397 (319433-016/Oct. 2013)
vmulsd	MULSD	Multiply Scalar Double- Precision Floating-Point Value	page 5-400 (319433-016/Oct. 2013)
vmulss	MULSS	Multiply Scalar Single- Precision Floating-Point Values	page 5-402 (319433-016/Oct. 2013)
vorpd	ORPD	Bitwise Logical OR of Double-Precision Floating- Point Values	page 4-13 (253667-048US/ Sep.2013)
vorps	ORPS	Bitwise Logical OR of Single-Precision Floating- Point Values	page 4-15 (253667-048US/ Sep.2013)
vpabs(w b d)	PABSB PABSW PABSD PABSQ	Packed Absolute Value	page 5-404 (319433-016/Oct. 2013)

	WRGSBASE	Base	048US/Sep.2013)

3.14 MMX Instructions

The MMX instructions enable x86 processors to perform single-instruction, multiple-data (SIMD) operations on packed byte, word, doubleword, or quadword integer operands contained in memory, in MMX registers, or in general-purpose registers.

3.14.1 Data Transfer Instructions (MMX)

The data transfer instructions move doubleword and quadword operands between MMX registers and between MMX registers and memory.

TABLE 31 Data Transfer Instructions (MMX)

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
movd	MOVD	move doubleword	movdq valid only under -m64
movq	MOVQ	move quadword	valid only under -m64

3.14.2 Conversion Instructions (MMX)

The conversion instructions pack and unpack bytes, words, and doublewords.

TABLE 32 Conversion Instructions (MMX)

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
packssdw	PACKSSDW	pack doublewords into words with signed saturation	
packsswb	PACKSSWB	pack words into bytes with signed saturation	
packuswb	PACKUSWB	pack words into bytes with unsigned saturation	
punpckhbw	PUNPCKHBW	unpack high-order bytes	
punpckhdq	PUNPCKHDQ	unpack high-order doublewords	
punpckhwd	PUNPCKHWD	unpack high-order words	
punpcklbw	PUNPCKLBW	unpack low-order bytes	
punpckldq	PUNPCKLDQ	unpack low-order doublewords	
punpcklwd	PUNPCKLWD	unpack low-order words	

3.14.3 Packed Arithmetic Instructions (MMX)

The packed arithmetic instructions perform packed integer arithmetic on packed byte, word, and doubleword integers.

TABLE 33 Packed Arithmetic Instructions (MMX)

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
paddb	PADDB	add packed byte integers	
paddd	PADDD	add packed doubleword integers	
paddsb	PADDSB	add packed signed byte integers with signed saturation	
paddsw	PADDSW	add packed signed word integers with signed saturation	
paddusb	PADDUSB	add packed unsigned byte integers with unsigned saturation	
paddusw	PADDUSW	add packed unsigned word integers with unsigned saturation	
paddw	PADDW	add packed word integers	
pmaddwd	PMADDWD	multiply and add packed word integers	
pmulhw	PMULHW	multiply packed signed word integers and store high result	
pmullw	PMULLW	multiply packed signed word integers and store low result	
psubb	PSUBB	subtract packed byte integers	
psubd	PSUBD	subtract packed doubleword integers	
psubsb	PSUBSB	subtract packed signed byte integers with signed saturation	
psubsw	PSUBSW	subtract packed signed word integers with signed saturation	
psubusb	PSUBUSB	subtract packed unsigned byte integers with unsigned saturation	
psubusw	PSUBUSW	subtract packed unsigned word integers with unsigned saturation	
psubw	PSUBW	subtract packed word integers	

3.14.4 Comparison Instructions (MMX)

The compare instructions compare packed bytes, words, or doublewords.

TABLE 34 Comparison Instructions (MMX)

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
pcmpeqb	PCMPEQB	compare packed bytes for equal	
pcmpeqd	PCMPEQD	compare packed doublewords for equal	
pcmpeqw	PCMPEQW	compare packed words for equal	
pcmpgtb	PCMPGTB	compare packed signed byte integers for greater than	
pcmpgtd	PCMPGTD	compare packed signed doubleword integers for greater than	
pcmpgtw	PCMPGTW	compare packed signed word integers for greater than	

3.14.5 Logical Instructions (MMX)

The logical instructions perform logical operations on quadword operands.

TABLE 35 Logical Instructions (MMX)

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
pand	PAND	bitwise logical AND	
pandn	PANDN	bitwise logical AND NOT	
por	POR	bitwise logical OR	
pxor	PXOR	bitwise logical XOR	

3.14.6 Shift and Rotate Instructions (MMX)

The shift and rotate instructions operate on packed bytes, words, doublewords, or quadwords in 64–bit operands.

TABLE 36 Shift and Rotate Instructions (MMX)

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
pslld	PSLLD	shift packed doublewords left logical	
psllq	PSLLQ	shift packed quadword left logical	
psllw	PSLLW	shift packed words left logical	
psrad	PSRAD	shift packed doublewords right arithmetic	
psraw	PSRAW	shift packed words right arithmetic	
psrld	PSRLD	shift packed doublewords right logical	
psrlq	PSRLQ	shift packed quadword right logical	
psrlw	PSRLW	shift packed words right logical	

3.14.7 State Management Instructions (MMX)

The emms (EMMS) instruction clears the MMX state from the MMX registers.

TABLE 37 State Management Instructions (MMX)

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
emms	EMMS	empty MMX state	

3.15 MOVBE Instructions

TABLE 38 MOVBE Instructions

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Reference
movbe(q l w)	movbe	Reverse byte order in <source/> and move to <destination></destination>	325383-050US 3-519 Vol. 2A

3.16 PCLMULQDQ Instructions

TABLE 39 PCLMULQDQ Instructions

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Reference
pclmulqdq	PCLMULQDQ	Carry-Less Multiplication Quadword	page 4-68 (253667-048US/ Sep.2013)

3.17 PREFETCH Instructions

TABLE 40 PREFETCH Instructions

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Reference
prefetch	PREFETCH		page 256 (AMD:24594- Rev.3.20-May.2013)
preftechw	PREFETCHW	Prefetch Data into Caches in Anticipation of a Write	page 872-873 (325383- 053US/Jan.2015) page 256 (AMD:24594- Rev.3.20-May.2013)
prefetchwt1	PREFETCHWT1	Prefetch Vector Data Into Caches with Internet to Write and T1 Hint	page 874-875 (325383- 053US/Jan.2015)

3.18 RDRAND Instructions

TABLE 41 RDRAND Instructions

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Reference
rdrand(q l w)	RDRAND	Returns a random number	page 10-1 (319433-016/ Oct.2013)

3.19 RDSEED Instructions

TABLE 42 RDSEED Instructions

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Reference
rdseed(w l q)	RDSEED	Read Random SEED	page 971-972 (325383- 053US/Jan.2015)

3.20 SSE Instructions

SSE instructions are an extension of the SIMD execution model introduced with the MMX technology. SSE instructions are divided into four subgroups:

- SIMD single-precision floating-point instructions that operate on the XMM registers
- MXSCR state management instructions
- 64–bit SIMD integer instructions that operate on the MMX registers
- Instructions that provide cache control, prefetch, and instruction ordering functionality

3.20.1 SIMD Single-Precision Floating-Point Instructions (SSE)

The SSE SIMD instructions operate on packed and scalar single-precision floating-point values located in the XMM registers or memory.

3.20.1.1 Data Transfer Instructions (SSE)

The SSE data transfer instructions move packed and scalar single-precision floating-point operands between XMM registers and between XMM registers and memory.

TABLE 43 Data Transfer Instructions (SSE)

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
movaps	MOVAPS	move four aligned packed single-precision floating- point values between XMM registers or memory	
movhlps	MOVHLPS	move two packed single- precision floating- point values from the high quadword of an XMM register to the low	

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
		quadword of another XMM register	
movhps	MOVHPS	move two packed single- precision floating-point values to or from the high quadword of an XMM register or memory	
movlhps	MOVLHPS	move two packed single- precision floating-point values from the low quadword of an XMM register to the high quadword of another XMM register	
movlps	MOVLPS	move two packed single- precision floating-point values to or from the low quadword of an XMM register or memory	
movmskps	MOVMSKPS	extract sign mask from four packed single- precision floating-point values	
movss	MOVSS	move scalar single- precision floating-point value between XMM registers or memory	
movups	MOVUPS	move four unaligned packed single-precision floating-point values between XMM registers or memory	

3.20.1.2 Packed Arithmetic Instructions (SSE)

SSE packed arithmetic instructions perform packed and scalar arithmetic operations on packed and scalar single-precision floating-point operands.

TABLE 44 Packed Arithmetic Instructions (SSE)

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
addps	ADDPS	add packed single- precision floating-point values	
addss	ADDSS	add scalar single-precision floating-point values	
divps	DIVPS	divide packed single- precision floating-point values	

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
divss	DIVSS	divide scalar single- precision floating-point values	
maxps	MAXPS	return maximum packed single-precision floating- point values	
maxss	MAXSS	return maximum scalar single-precision floating- point values	
minps	MINPS	return minimum packed single-precision floating- point values	
minss	MINSS	return minimum scalar single-precision floating-point values.	
mulps	MULPS	multiply packed single- precision floating-point values	
mulss	MULSS	multiply scalar single- precision floating-point values	
rcpps	RCPPS	compute reciprocals of packed single-precision floating-point values	
rcpss	RCPSS	compute reciprocal of scalar single-precision floating-point values	
rsqrtps	RSQRTPS	compute reciprocals of square roots of packed single-precision floating- point values	
rsqrtss	RSQRTSS	compute reciprocal of square root of scalar single-precision floating- point values	
sqrtps	SQRTPS	compute square roots of packed single-precision floating-point values	
sqrtss	SQRTSS	compute square root of scalar single-precision floating-point values	
subps	SUBPS	subtract packed single- precision floating-point values	
subss	SUBSS	subtract scalar single- precision floating-point values	

3.20.1.3 Comparison Instructions (SSE)

The SEE compare instructions compare packed and scalar single-precision floating-point operands.

TABLE 45 Comparison Instructions (SSE)

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
cmpps	CMPPS	compare packed single- precision floating-point values	
cmpss	CMPSS	compare scalar single- precision floating-point values	
comiss	COMISS	perform ordered comparison of scalar single-precision floating- point values and set flags in EFLAGS register	
ucomiss	UCOMISS	perform unordered comparison of scalar single-precision floating- point values and set flags in EFLAGS register	

3.20.1.4 Logical Instructions (SSE)

The SSE logical instructions perform bitwise AND, AND NOT, OR, and XOR operations on packed single-precision floating-point operands.

TABLE 46Logical Instructions (SSE)

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
andnps	ANDNPS	perform bitwise logical AND NOT of packed single-precision floating- point values	
andps	ANDPS	perform bitwise logical AND of packed single- precision floating-point values	
orps	ORPS	perform bitwise logical OR of packed single-precision floating-point values	
xorps	XORPS	perform bitwise logical XOR of packed single- precision floating-point values	

3.20.1.5 Shuffle and Unpack Instructions (SSE)

The SSE shuffle and unpack instructions shuffle or interleave single-precision floating-point values in packed single-precision floating-point operands.

TABLE 47 Shuffle and Unpack Instructions (SSE)

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
shufps	SHUFPS	shuffles values in packed single-precision floating- point operands	
unpckhps	UNPCKHPS	unpacks and interleaves the two high-order values from two single-precision floating-point operands	
unpcklps	UNPCKLPS	unpacks and interleaves the two low-order values from two single-precision floating-point operands	

3.20.1.6 Conversion Instructions (SSE)

The SSE conversion instructions convert packed and individual doubleword integers into packed and scalar single-precision floating-point values.

TABLE 48 Conversion Instructions (SSE)

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
cvtpi2ps	CVTPI2PS	convert packed doubleword integers to packed single-precision floating-point values	
cvtps2pi	CVTPS2PI	convert packed single- precision floating- point values to packed doubleword integers	
cvtsi2ss	CVTSI2SS	convert doubleword integer to scalar single- precision floating-point value	
cvtss2si	CVTSS2SI	convert scalar single- precision floating-point value to a doubleword integer	
cvttps2pi	CVTTPS2PI	convert with truncation packed single-precision floating-point values to packed doubleword integers	

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
cvttss2si	CVTTSS2SI	convert with truncation scalar single-precision floating-point value to scalar doubleword integer	

3.20.2 MXCSR State Management Instructions (SSE)

The MXCSR state management instructions save and restore the state of the MXCSR control and status register.

TABLE 49 MXCSR State Management Instructions (SSE)

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
ldmxcsr	LDMXCSR	load %mxcsr register	
stmxcsr	STMXCSR	save %mxcsr register state	

3.20.3 64-Bit SIMD Integer Instructions (SSE)

The SSE 64–bit SIMD integer instructions perform operations on packed bytes, words, or doublewords in MMX registers.

TABLE 50 64–Bit SIMD Integer Instructions (SSE)

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
pavgb	PAVGB	compute average of packed unsigned byte integers	
pavgw	PAVGW	compute average of packed unsigned byte integers	
pextrw	PEXTRW	extract word	
pinsrw	PINSRW	insert word	
pmaxsw	PMAXSW	maximum of packed signed word integers	
pmaxub	PMAXUB	maximum of packed unsigned byte integers	
pminsw	PMINSW	minimum of packed signed word integers	
pminub	PMINUB	minimum of packed unsigned byte integers	
pmovmskb	PMOVMSKB	move byte mask	
pmulhuw	PMULHUW	multiply packed unsigned integers and store high result	

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
psadbw	PSADBW	compute sum of absolute differences	
pshufw	PSHUFW	shuffle packed integer word in MMX register	

3.20.4 Miscellaneous Instructions (SSE)

The following instructions control caching, prefetching, and instruction ordering.

TABLE 51 Miscellaneous Instructions (SSE)

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
maskmovq	MASKMOVQ	non-temporal store of selected bytes from an MMX register into memory	
movntps	MOVNTPS	non-temporal store of four packed single-precision floating-point values from an XMM register into memory	
movntq	MOVNTQ	non-temporal store of quadword from an MMX register into memory	
prefetchnta	PREFETCHNTA	prefetch data into non- temporal cache structure and into a location close to the processor	
prefetcht0	PREFETCHT0	prefetch data into all levels of the cache hierarchy	
prefetcht1	PREFETCHT1	prefetch data into level 2 cache and higher	
prefetcht2	PREFETCHT2	prefetch data into level 2 cache and higher	
sfence	SFENCE	serialize store operations	

3.21 SSE2 Instructions

SSE2 instructions are an extension of the SIMD execution model introduced with the MMX technology and the SSE extensions. SSE2 instructions are divided into four subgroups:

Packed and scalar double-precision floating-point instructions

- Packed single-precision floating-point conversion instructions
- 128-bit SIMD integer instructions
- Instructions that provide cache control and instruction ordering functionality

3.21.1 SSE2 Packed and Scalar Double-Precision Floating-Point Instructions

The SSE2 packed and scalar double-precision floating-point instructions operate on double-precision floating-point operands.

3.21.1.1 SSE2 Data Movement Instructions

The SSE2 data movement instructions move double-precision floating-point data between XMM registers and memory.

TABLE 52 SSE2 Data Movement Instructions

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
movapd	MOVAPD	move two aligned packed double-precision floating- point values between XMM registers and memory	
movhpd	MOVHPD	move high packed double- precision floating-point value to or from the high quadword of an XMM register and memory	
movlpd	MOVLPD	move low packed single- precision floating-point value to or from the low quadword of an XMM register and memory	
movmskpd	MOVMSKPD	extract sign mask from two packed double-precision floating-point values	
movsd	MOVSD	move scalar double- precision floating-point value between XMM registers and memory.	
movupd	MOVUPD	move two unaligned packed double-precision floating-point values between XMM registers and memory	

3.21.1.2 SSE2 Packed Arithmetic Instructions

The SSE2 arithmetic instructions operate on packed and scalar double-precision floating-point operands.

TABLE 53 SSE2 Packed Arithmetic Instructions

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
addpd	ADDPD	add packed double- precision floating-point values	
addsd	ADDSD	add scalar double- precision floating-point values	
divpd	DIVPD	divide packed double- precision floating-point values	
divsd	DIVSD	divide scalar double- precision floating-point values	
maxpd	MAXPD	return maximum packed double-precision floating- point values	
maxsd	MAXSD	return maximum scalar double-precision floating- point value	
minpd	MINPD	return minimum packed double-precision floating- point values	
minsd	MINSD	return minimum scalar double-precision floating- point value	
mulpd	MULPD	multiply packed double- precision floating-point values	
mulsd	MULSD	multiply scalar double- precision floating-point values	
sqrtpd	SQRTPD	compute packed square roots of packed double- precision floating-point values	
sqrtsd	SQRTSD	compute scalar square root of scalar double-precision floating-point value	
subpd	SUBPD	subtract packed double- precision floating-point values	

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
subsd	SUBSD	subtract scalar double- precision floating-point values	

3.21.1.3 SSE2 Logical Instructions

The SSE2 logical instructions operate on packed double-precision floating-point values.

TABLE 54 SSE2 Logical Instructions

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
andnpd	ANDNPD	perform bitwise logical AND NOT of packed double-precision floating- point values	
andpd	ANDPD	perform bitwise logical AND of packed double- precision floating-point values	
orpd	ORPD	perform bitwise logical OR of packed double-precision floating-point values	
xorpd	XORPD	perform bitwise logical XOR of packed double- precision floating-point values	

3.21.1.4 SSE2 Compare Instructions

The SSE2 compare instructions compare packed and scalar double-precision floating-point values and return the results of the comparison to either the destination operand or to the EFLAGS register.

TABLE 55 SSE2 Compare Instructions

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
cmppd	CMPPD	compare packed double- precision floating-point values	
cmpsd	CMPSD	compare scalar double- precision floating-point values	
comisd	COMISD	perform ordered comparison of scalar double-precision floating- point values and set flags in EFLAGS register	

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
ucomisd	UCOMISD	perform unordered comparison of scalar double-precision floating- point values and set flags in EFLAGS register	

3.21.1.5 SSE2 Shuffle and Unpack Instructions

The SSE2 shuffle and unpack instructions operate on packed double-precision floating-point operands.

TABLE 56 SSE2 Shuffle and Unpack Instructions

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
shufpd	SHUFPD	shuffle values in packed double-precision floating- point operands	
unpckhpd	UNPCKHPD	unpack and interleave the high values from two packed double-precision floating-point operands	
unpcklpd	UNPCKLPD	unpack and interleave the low values from two packed double-precision floating-point operands	

3.21.1.6 SSE2 Conversion Instructions

The SSE2 conversion instructions convert packed and individual doubleword integers into packed and scalar double-precision floating-point values (and vice versa). These instructions also convert between packed and scalar single-precision and double-precision floating-point values.

TABLE 57 SSE2 Conversion Instructions

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
cvtdq2pd	CVTDQ2PD	convert packed doubleword integers to packed double-precision floating-point values	
cvtpd2dq	CVTPD2DQ	convert packed double- precision floating- point values to packed doubleword integers	
cvtpd2pi	CVTPD2PI	convert packed double- precision floating-	

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
		point values to packed doubleword integers	
cvtpd2ps	CVTPD2PS	convert packed double- precision floating-point values to packed single- precision floating-point values	
cvtpi2pd	CVTPI2PD	convert packed doubleword integers to packed double-precision floating-point values	
cvtps2pd	CVTPS2PD	convert packed single- precision floating-point values to packed double- precision floating-point values	
cvtsd2si	CVTSD2SI	convert scalar double- precision floating-point values to a doubleword integer	
cvtsd2ss	CVTSD2SS	convert scalar double- precision floating-point values to scalar single- precision floating-point values	
cvtsi2sd	CVTS12SD	convert doubleword integer to scalar double- precision floating-point value	
cvtss2sd	CVTSS2SD	convert scalar single- precision floating-point values to scalar double- precision floating-point values	
cvttpd2dq	CVTTPD2DQ	convert with truncation packed double-precision floating-point values to packed doubleword integers	
cvttpd2pi	CVTTPD2PI	convert with truncation packed double-precision floating-point values to packed doubleword integers	
cvttsd2si	CVTTSD2SI	convert with truncation scalar double-precision floating-point values to scalar doubleword integers	

3.21.2 SSE2 Packed Single-Precision Floating-Point Instructions

The SSE2 packed single-precision floating-point instructions operate on single-precision floating-point and integer operands.

TABLE 58 SSE2 Packed Single-Precision Floating-Point Instructions

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
cvtdq2ps	CVTDQ2PS	convert packed doubleword integers to packed single-precision floating-point values	
cvtps2dq	CVTPS2DQ	convert packed single- precision floating- point values to packed doubleword integers	
cvttps2dq	CVTTPS2DQ	convert with truncation packed single-precision floating-point values to packed doubleword integers	

3.21.3 SSE2 128-Bit SIMD Integer Instructions

The SSE2 SIMD integer instructions operate on packed words, doublewords, and quadwords contained in XMM and MMX registers.

TABLE 59 SSE2 128–Bit SIMD Integer Instructions

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
movdq2q	MOVDQ2Q	move quadword integer from XMM to MMX registers	
movdqa	MOVDQA	move aligned double quadword	
movdqu	MOVDQU	move unaligned double quadword	
movq2dq	MOVQ2DQ	move quadword integer from MMX to XMM registers	
paddq	PADDQ	add packed quadword integers	
pmuludq	PMULUDQ	multiply packed unsigned doubleword integers	

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
pshufd	PSHUFD	shuffle packed doublewords	
pshufhw	PSHUFHW	shuffle packed high words	
pshuflw	PSHUFLW	shuffle packed low words	
pslldq	PSLLDQ	shift double quadword left logical	
psrldq	PSRLDQ	shift double quadword right logical	
psubq	PSUBQ	subtract packed quadword integers	
punpckhqdq	PUNPCKHQDQ	unpack high quadwords	
punpcklqdq	PUNPCKLQDQ	unpack low quadwords	

3.21.4 SSE2 Miscellaneous Instructions

The SSE2 instructions described below provide additional functionality for caching non-temporal data when storing data from XMM registers to memory, and provide additional control of instruction ordering on store operations.

TABLE 60 SSE2 Miscellaneous Instructions

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
clflush	CLFLUSH	flushes and invalidates a memory operand and its associated cache line from all levels of the processor's cache hierarchy	
lfence	LFENCE	serializes load operations	
maskmovdqu	MASKMOVDQU	non-temporal store of selected bytes from an XMM register into memory	
mfence	MFENCE	serializes load and store operations	
movntdq	MOVNTDQ	non-temporal store of double quadword from an XMM register into memory	
movnti	MOVNTI	non-temporal store of a doubleword from a general-purpose register into memory	movntiq valid only under -m64
movntpd	MOVNTPD	non-temporal store of two packed double-precision floating-point values from	

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
		an XMM register into memory	
pause	PAUSE	improves the performance of spin-wait loops	

3.22 SSE3 Instructions

TABLE 61 SSE3 Instructions

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Reference
addsubpd	ADDSUBPD	Packed Double-FP Add/ Subtract	page 3-35 (253666- 048US/Sep.2013)
addsubps	ADDSUBPS	Packed Single-FP Add/ Subtract	page 3-37 (253666- 048US/Sep.2013)

3.28 Operating System Support Instructions

The operating system support instructions provide functionality for process management, performance monitoring, debugging, and other systems tasks.

TABLE 68 Operating System Support Instructions

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
arpl	ARPL	adjust requested privilege level	
clts	CLTS	clear the task-switched flag	
hlt	HLT	halt processor	
invd	INVD	invalidate cache, no writeback	
invlpg	INVLPG	invalidate TLB entry	
lar	LAR	load access rights	larq valid only under -m64
lgdt	LGDT	load global descriptor table (GDT) register	
lidt	LIDT	load interrupt descriptor table (IDT) register	
lldt	LLDT	load local descriptor table (LDT) register	
lmsw	LMSW	load machine status word	
lock	LOCK	lock bus	
lsl	LSL	load segment limit lslq valid only under -	
ltr	LTR	load task register	
rdmsr	RDMSR	read model-specific register	
rdpmc	RDPMC	read performance monitoring counters	
rdtsc	RDTSC	read time stamp counter	

Oracle Solaris Mnemonic	Intel/AMD Mnemonic	Description	Notes
rsm	RSM	return from system management mode (SMM)	
sgdt	SGDT	store global descriptor table (GDT) register	
sidt	SIDT	store interrupt descriptor table (IDT) register	
sldt	SLDT	store local descriptor table (LDT) register	sldtq valid only under -m64
smsw	SMSW	store machine status word smswq valid only ur -m64	
str	STR	store task register strq valid only unde	
sysenter	SYSENTER	fast system call, transfers to a flat protected model kernel at CPL=0	
sysexit	SYSEXIT	fast system call, transfers to a flat protected mode kernal at CPL=3	
verr	VERR	verify segment for reading	
verw	VERW	verify segment for writing	
wbinvd	WBINVD	invalidate cache, with writeback	
wrmsr	WRMSR	write model-specific register	

3.29 VMX Instructions

3.32 64-Bit AMD Opteron Considerations

To assemble code for the AMD Opteron CPU, invoke the assembler with the -m64 command line option. See the as(1) man page for additional information.

The following Oracle Solaris mnemonics are only valid when the -m64 command line option is specified:

adcq	cmovnoq	mulq
addq	cmovnpq	negq
andq	cmovnsq	notq
bsfq	cmovnzq	orq
bsrq	cmovoq	popfq
bswapq	cmovpeq	popq
btcq	cmovpoq	pushfq
btq	cmovpq	pushq
btrq	cmovsq	rclq
btsq	cmovzq	rcrq
cltq	cmpq	rolq
cmovaeq	cmpsq	rorq
cmovaq	cmpxchgq	salq
cmovbeq	cqtd	sarq
cmovbq	cqto	sbbq
cmovcq	decq	scasq
cmoveq	divq	shldq
cmovgeq	idivq	shlq
cmovgq	imulq	shrdq
cmovleq	incq	shrq
cmovlq	larq	sldtq
cmovnaeq	leaq	smswq
cmovnaq	lodsq	stosq
cmovnbeq	lslq	strq
cmovnbq	movabs	subq
cmovncq	movdq	testq
cmovneq	movntiq	xaddq
cmovngeq	movq	xchgq
cmovngq	movsq	xchgqA
cmovnleq	movswq	xorq
cmovnlq	movzwq	

The following Oracle Solaris mnemonics are *not* valid when the -m64 command line option is specified:

aaa	daa	lesw
aad	das	popa
aam	into	popaw
aas	jecxz	pusha
boundw	ldsw	pushaw

+++ APPENDIX A

Using the Assembler Command Line

This appendix describes how to invoke the assembler from the command line, and details the command-line options.

A.1 Assembler Command Line

You invoke the assembler command line as follows:

as [options] [inputfile] ...

Note - The Oracle Solaris Studio C, C++, and Fortran compilers (cc(1), CC(1), and f95(1)) invoke the assembler with the fbe command. You can use either the as or fbe command on a Oracle Solaris platform to invoke the assembler. On an Oracle Solaris x86 platform, the as or fbe command will invoke the x86 assembler. On an Oracle Solaris SPARC platform, the command invokes the SPARC assembler.

The as command translates the assembly language source files, <code>inputfile</code>, into an executable object file, <code>objfile</code>. The assembler recognizes the filename argument <code>hyphen</code> (-) as the standard input. It accepts more than one file name on the command line. The input file is the concatenation of all the specified files. If an invalid option is given or the command line contains a syntax error, the assembler prints the error (including a synopsis of the command line syntax and options) to standard error output, and then terminates.

The assembler supports macros, #include files, and symbolic substitution through use of the C preprocessor cpp(1). The assembler invokes the preprocessor before assembly begins if it has been specified from the command line as an option. (See the -P option.)

A.2 Assembler Command Line Options

Allow 32-bit addresses in 64-bit mode.

-Dname -Dname=def

When the -P option is in effect, these options are passed to the cpp preprocessor without interpretation by the as command; otherwise, they are ignored.

- {n}H

Enable (-H) or suppress (-nH) generation of the Hardware Capabilities section.

- Ipath

When the -P option is in effect, this option is passed to the cpp preprocessor without interpretation by the as command; otherwise, it is ignored.

-i

Ignore line number information from the preprocessor.

-KPIC

Check for address referencing with absolute relocation and issue warning.

- m

This option runs m4 macro preprocessing on input. The m4 preprocessor is more useful for complex preprocessing than the C preprocessor invoked by the -P option. See the m4(1) man page for more information about the m4 macro-processor.

-m64|-m32

Select the 64-bit (-m64) or 32-bit (-m32) memory model. With -m64, the resulting .o object files are in 64-bit ELF format and can only be linked with other object files in the same format. The resulting executable can only be run on a 64-bit x86 processor running 64-bit Oracle Solaris OS. -m32 is the default.

- n

Suppress all warnings while assembling.

-o outfile

Write the output of the assembler to *outfile*. By default, if –o is not specified, the output file name is the same as the input file name with .s replaced with .o.

- P

Run cpp(1), the C preprocessor, on the files being assembled. The preprocessor is run separately on each input file, not on their concatenation. The preprocessor output is passed to the assembler.

-Q{y|n}

This option produces the "assembler version" information in the comment section of the output object file if the y option is specified; if the n option is specified, the information is suppressed.

-S[a|b|c|l|A|B|C|L]

Produces a disassembly of the emitted code to the standard output. Adding each of the following characters to the -S option produces:

- a disassembling with address
- b disassembling with ".bof"
- c disassembling with comments
- 1 disassembling with line numbers

Capital letters turn the switch off for the corresponding option.

- S

This option places all stabs in the ".stabs" section. By default, stabs are placed in "stabs. excl" sections, which are stripped out by the static linker ld during final execution. When the -s option is used, stabs remain in the final executable because ".stab" sections are not stripped out by the static linker ld.

-Uname

When the -P option is in effect, this option is passed to the cpp preprocessor without interpretation by the as command; otherwise, it is ignored.

-V

This option writes the version information on the standard error output.

-xchip=processor

processor specifies the target architecture processor. When there is a choice between several possible encodings, choose the one that is appropriate for the stated chip. In particular, use the appropriate no-op byte sequence to fill code alignment padding, and warn when instructions not defined for the stated chip are used.

The assembler accepts the instruction sets for the following recognized -xchip processor values:

processor value	Target Processor
generic	Generic x86
native	Host processor.
core2	Intel Core2
nehalem	Intel Nehalem
opteron	AMD Opteron
penryn	Intel Penryn
pentium	Intel Pentium
pentium_pro	Intel Pentium Pro
pentium3	Intel Pentium 3.
pentium4	Intel Pentium 4
sandybridge	Intel Sandy Bridge
westmere	Intel Westmere
amdfam10	AMD FAM10
ivybridge	Intel Ivy Bridge
haswell	Intel Hawell
broadwell	Intel Broadwell

-xmodel=[small | medium | kernel]

For -m64 only, generate R_X86_64_32S relocatable type for data access under kernel. Otherwise, generate R_X86_64_32 under small. SHN_AMD64_LCOMMON and .lbcomm support added under medium. The default is small.

 $-Y\{d|m\}$, path

Specify the path to locate the version of cm4defs (-Yd, path) or m4 (-Ym, path) to use.

-YI, path

Indicate path to search for #include header files.

A.3 Disassembling Object Code

The dis program is the object code disassembler for ELF. It produces an assembly language listing of the object file. For detailed information about this function, see the dis(1) man page.
